UC8151

All-in-one driver IC with Timing Controller for Whte/Black/Red Dot-Matrix Micro-Cup ESL

Introduction

This driver is an all-in-one driver with timing controller for ESL. Its output is of 1-bit white/black and 1-bit red resolution per pixel. The timing controller provides control signals for the source driver and gate drivers.

The DC-DC controller allows it to generate the source output voltage VDH/VDL ($\pm 2.4 \text{V}{\sim} \pm 11 \text{V}).$ The chip also includes an output buffer for the supply of the COM electrode (VCOMAC or VCOMDC). The system is configurable through a 3-wire/4-wire (SPI) serial interface.

Note: (1) All other register addresses are invalid or reserved by UltraChip, and should NOT be used.

- (2) Any bits shown here as 0 must be written with a 0. All unused bits should also be set to zero. Device malfunction may occur if this is not done.
- (3) Commands are processed on the 'stop' condition of the interface.
- (4) Registers marked 'W/R' can be read, but the contents are written when the SPI command completes so the contents can be read and altered. The user can subsequently write the register to restore the contents following an SPI read.

This command starts transmitting data and write them into SRAM. To complete data transmission, command DSP (Data transmission Stop) must be issued. Then the chip will start to send data/VCOM for panel.

In B/W mode, this command writes "OLD" data to SRAM.

In B/W/Red mode, this command writes "B/W" data to SRAM.

In Program mode, this command writes "OTP" data to SRAM for programming.

(10) DATA STOP (DSP) (R11H)

| Action | W/R | C/D | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |

| Stopping data transmission | 1 | 1 | data_flag | - | - | - , | \ \ - | - | - | - | 00h |

To stop data transmission, this command must be issued to check the data_flag.

Data_flag: Data flag of receiving user data.

0: Driver didn't receive all the data.

1: Driver has already received all the one-frame data (DTM1 and DTM2).

After "Data Start" (10h) or "Data Stop" (11h) commands and when data_flag=1, BUSY_N signal will become "0" and the refreshing of panel starts.

(11) DISPLAY REFRESH (DRF) (R12H)

| Action | W/R | C/D | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
|------------------------|-----|-----|----|----|----|----|----|----|----|----|-----|
| Refreshing the display | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 12h |

While user sent this command, driver will refresh display (data/VCOM) according to SRAM data and LUT.

After Display Refresh command, BUSY_N signal will become "0" and the refreshing of panel starts.

(12) DATA START TRANSMISSION 2 (DTM2) (R13H)

| Action | W/R | C/D | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |

This command starts transmitting data and write them into SRAM. To complete data transmission, command DSP (Data transmission Stop) must be issued. Then the chip will start to send data/VCOM for panel.

In B/W mode, this command writes "NEW" data to SRAM.

In B/W/Red mode, this command writes "RED" data to SRAM.

POWER MANAGEMENT

Power ON Sequence

 $T_{pwr_on} = \sim 80ms \text{ (default)}$

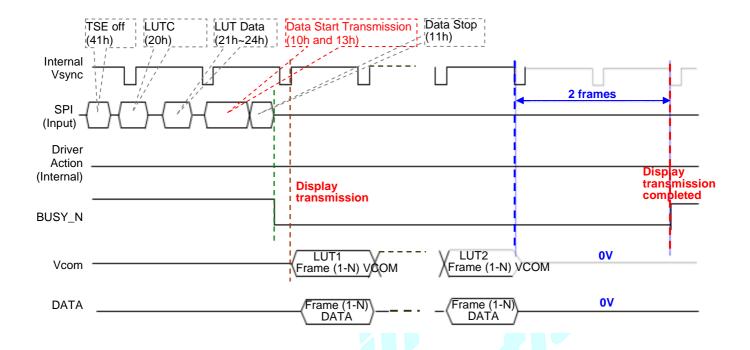

Power OFF Sequence

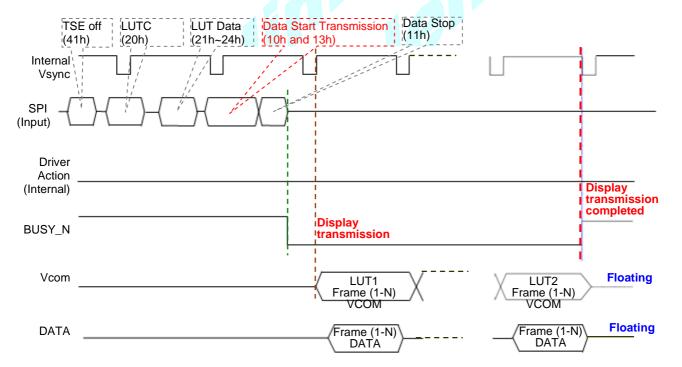

Data Transmission Waveform

Example 1: LUT all states (7 states) complete or phase number=0, the driver will send 2 frame VCOM and data to 0 V.

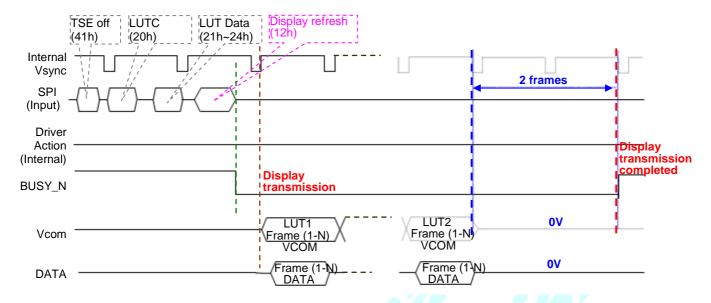

Example 2: While level selection in LUT is "11", the driver will float VCOM and data.

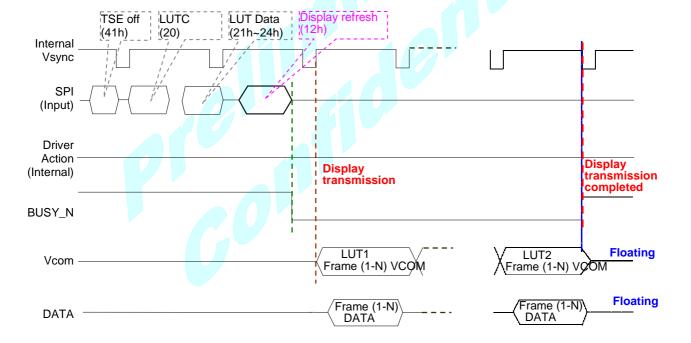

Display Refresh Waveform

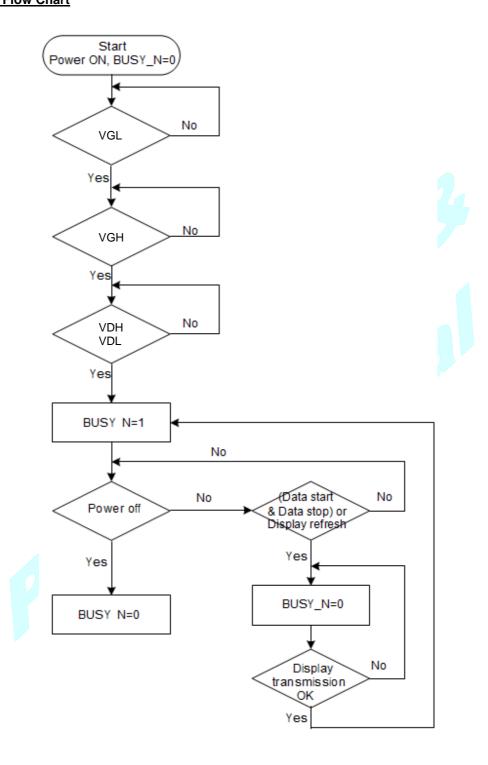

Example 1: LUT all states (7 states) complete or phase number=0, the driver will send 2 frame VCOM and data to 0 V.

Example2: While level selection in LUT is "11", the driver will float VCOM and data.

Warning:

If ICs are stressed beyond those listed above "absolute maximum ratings", they may be permanently destroyed. These are stress ratings only, and functional operation of the device at these or any other condition beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
